Impact evaluation: using  
quasi-experimental  
designs in HE evaluation

#TasoCon24

## Who we are

**Sonia Ilie**  
Associate Professor  
University of Cambridge

**Mike Kerrigan**  
Head of Research and Insights (Access  
and Participation)  
Nottingham Trent University

# Overview of session

- 1 Impact evaluation
- 2 Quasi-experimental designs (QEDs)
- 3 A practical example
- 4 Q&A

# Evaluation should ideally be . . .

Flexible

Practical

Informative  
(to others)

Robust

# The challenge of impact evaluation

1

How can we tell that a programme causes **impact**?

2

The challenge: **estimating the counterfactual**

3

The counterfactual usually achieved through **random assignment**

4

If randomisation not possible - **Quasi-experimental designs**

# Estimating the counterfactual

While **random assignment** usually generates the strongest counterfactual (the control group), QEDs can estimate the counterfactual through statistical means.

# Estimating the counterfactual

The counterfactual in QEDs is not always as strong as that obtained through random variation, because it cannot always avoid self-selection bias completely.

# Quasi-experimental designs

Can be deployed creatively, to make use of ‘natural’ or ‘random’ variation in programme implementation.

# Quasi-experimental designs

Can generate a comparison group as similar as possible to the intervention group, making use of existing data on:

- previous cohorts
- participants just ineligible
- non-participants due to oversubscription
- non-participants due to time considerations?

# Quasi-experimental designs

Come in a variety of forms and use a variety of statistical approaches.

Therefore, understanding the intervention in detail, through a robust theory of change, is essential.

TASO

# Quasi-experimental design approaches

#TasoCon24

## Before-and-after designs (first difference)

- The weakest of all QEDs, usually **not considered as QED-proper**
- The counterfactual is the weakest, because it assumes that 'no changes would have occurred in the absence of the programme'; and because it cannot account for any confounding influences, any other factors that may impact on the outcome
- Generate Type 2 evidence, but without attribution of impact

# Difference-in-difference (second difference)

A robust,  
widely-used and  
well-understood  
QED approach

# Difference-in-difference

- Provide strong evidence of impact (if present), especially if combined with matching (coming up!)
- They allow for unobserved heterogeneity in between groups
- But data needs to meet several assumptions:
  - The unobserved heterogeneity is time-invariant and
  - The pre-intervention difference in groups is (and would remain) constant
  - An understanding of selection is required

## A side note: natural experiments

- Very similar logic to that of both Diff-in-Diff and experimental (RCT) designs.
- Common logic in education - the intervention is:
  - assigned systematically at the level of school/HEP/region/etc., and also
  - assigned randomly at the level of the individual
- This can isolate the impact of the intervention being evaluated

# Matching approaches

- The most common is Propensity Score Matching (PSM)
  - can generate a good counterfactual but doesn't always work as planned and therefore generates strong Type 2 evidence but not always Type 3.
- Other matching approaches include:
  - matching to a given distribution (in terms of frequency)
  - synthetic control
  - case-control matching

# Propensity Score Matching (PSM)

Looks to generate a comparison group similar to the intervention group in terms of individuals' probability to take up an intervention

This propensity is calculated as a function of a (large set of) background characteristics

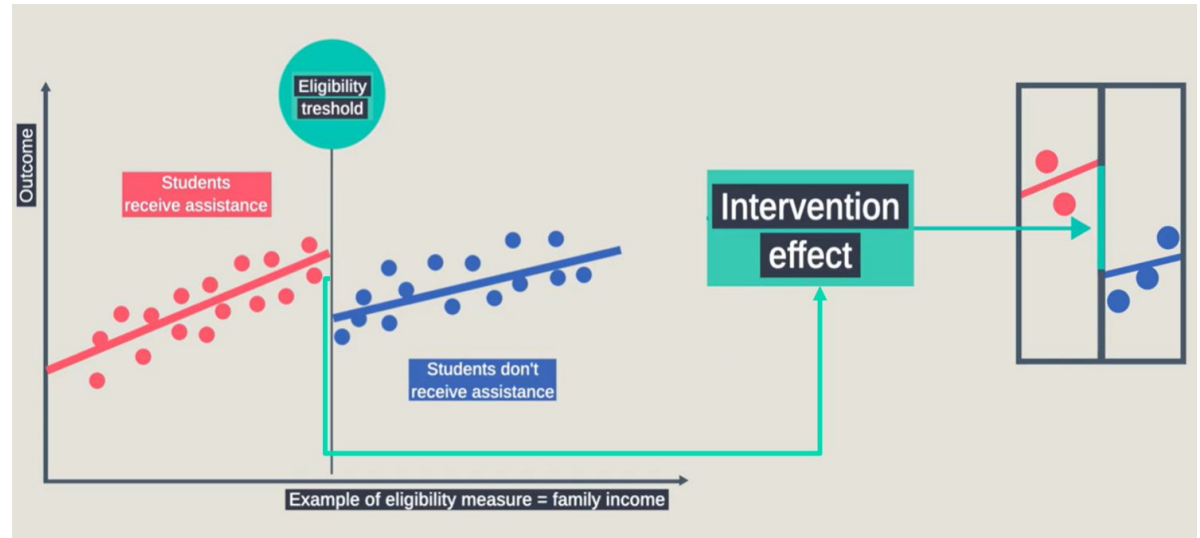

# Propensity Score Matching (PSM)

- Requires the empirical identification of factors associated with intervention take up and that unobserved factors do not affect participation (conditional independence)
- Requires ‘good matches’ (common support) – this does not always happen
- Depends on very large number of analytical decisions which affect the strength of the counterfactual and therefore of the causal inference

# Regression discontinuity designs

Makes use of eligibility thresholds to compare the outcomes of those immediately either side of the threshold

# Regression discontinuity designs

Can generate a strong counterfactual but have substantial assumptions and data needs

- There needs to be a suitable cut-off point for receiving the intervention
  - This cut-off or threshold is not always very precise
- Typically requires existing administrative data
  - This reduces the need for data collection
  - *But* the amount of data required is high, especially around the threshold, and for those not eligible (sometimes difficult!)
- It can only tell you about the impact on individuals closest to the threshold, not those further away – ‘local treatment effect’

## Many other QEDs exists

- Instrumental variable analysis (IV)
- Interrupted time series analysis
- Other matching techniques

All require specialist technical input

TASO

# Institutional Data Use Project

Exploring QEDs with institutional data:  
practical guide

Mike Kerrigan, Nottingham Trent University

#TasoCon24

# Methods explored

1

~~Regression discontinuity design~~

2

~~Difference in difference~~

3

Propensity score matching / case control matching

4

Logistic regression

# Institutional data sets

- 1 Enrolment and outcomes data (HESA return)
- 2 NTU student dashboard
- 3 Participants of post-entry activities (2022/23 ECAs)
- 4 Importance of identifying influential covariates

# Case control matching (CCM)

- 1 Used in observation studies – reduce selection bias
- 2 Pairs participants with non-participants
- 3 On factors known to influence the outcome
- 4 Can apply tolerances – sample size v good matches

# Propensity score matching (PSM)

- 1 Estimates probability that students will participate\*
- 2 Based on combination of characteristics (covariates)
- 3 Pairs participants with non-participants (PSM score)
- 4 Again, tolerances can be applied (different to CCM)

\* Even though, as this is retrospective, we already know who participated!

# Four stages in propensity score matching

- 1 Estimate propensity scores based on the covariates
- 2 Match individual participant with a 'partner'
- 3 Check for balance in mean propensity scores
- 4 Estimate intervention effect and interpret results

# Some reflections (before results)

- CCM & PSM not too difficult to do with statistical software
- But they can be difficult to do well
- Do *not* just shove all your data into a statistical package
- Consider the factors that influence participation and outcome
- Consider a regression analysis to inform covariates
- Consider the Level of study (if Level 6, can use Level 5 attainment as a covariate)

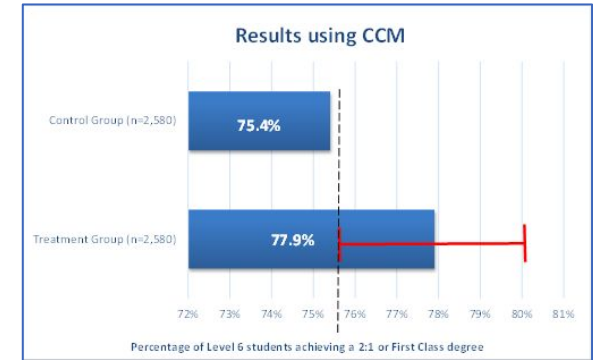

# Some reflections (before results)

- Trade-off between sample size and good matches / balance
- Avoid 'p-hacking'
- Are there known and/or unknown unobservable factors?
- Can we achieve Type 3 (causal) using matching methods?

# Some tentative results

- In both cases treatment group had higher rates of 2:1 / First than control group ( $p < 0.05$ )
- 'Effect' size seemingly higher in PSM (4 pps diff) than CCM... (2.5 pps diff)
- But these effect sizes were considerably lower than the aggregated analysis of participants v non-participants (13 pps)
- Similar trends found for Levels 4 and 5 GBA
- Confirms considerable selection bias that must be controlled for

# Some tentative results

- Very useful learning exercise – try it!
- Institutional datasets are complex
- Type 3 causal methodologies (RCT, DiD, RDD) not always feasible
- But robust evidence of impact can still be gleaned using alternatives
- These methodologies provided strong Type 2 evidence of impact (Type 2.5?).

As good evidence as we are going to get with retrospective data? A pragmatic solution?

# Some tentative conclusions

- Recommended that the learnings are considered, and methodologies tweaked with evaluation built into the design of post-entry activities
- Explore outcomes data suited to DiD? E.g. module attainment?
- This will further develop opportunities to deliver causal evaluation

# Example 1

‘Variability of sleep duration might be more relevant to well-being than sleep duration itself’

## RESEARCH ARTICLE

# The Relationships between Life Satisfaction and Sleep Quality, Sleep Duration and Variability of Sleep in University Students

Torunn Emilie Bækø Ness and Ingvild Saksvik-Lehouillier

Life satisfaction and its relationship to aspects of sleep were investigated in 701 Norwegian university students using recreated sleep logs, questions about sleep-related experiences, a sleep quality item and the Satisfaction with Life Scale. The results indicated that better sleep quality, longer mean sleep duration, less variability in sleep duration and less variability in rise time were all associated with greater life satisfaction, but only sleep quality and variability of sleep duration were significant predictors of life satisfaction in a regression model. Consistent with previous research, the results emphasize the importance of sleep quality, and adds to existing research by suggesting that in some populations, variability of sleep duration might be more relevant to well-being than sleep duration itself.

## Example 2

‘Among female students, both shortened and prolonged sleep durations were associated with increased likelihood of obesity. Among male students, there was no significant association’

Research Article | Open Access

Volume 2012 | Article ID 476914 | <https://doi.org/10.1155/2012/476914>

### Association of Sleep Duration with Obesity among US High School Students

Richard Lowry <sup>1</sup>, Danice K. Eaton,<sup>1</sup> Kathryn Foti,<sup>1</sup> Lela McKnight-Eilly,<sup>2</sup> Geraldine Perry,<sup>2</sup> and Deborah A. Galuska<sup>3</sup>

#### Abstract

Increasing attention is being focused on sleep duration as a potential modifiable risk factor associated with obesity in children and adolescents. We analyzed data from the national Youth Risk Behavior Survey to describe the association of obesity (self-report BMI  $\geq 95$ th percentile) with self-reported sleep duration on an average school night, among a representative sample of US high school students. Using logistic regression to control for demographic and behavioral confounders, among female students, compared to 7 hours of sleep, both shortened ( $\leq 4$  hours of sleep; adjusted odds ratio (95% confidence interval), AOR = 1.50 (1.05–2.15)) and prolonged ( $\geq 9$  hours of sleep; AOR = 1.54 (1.13–2.10)) sleep durations were associated with increased likelihood of obesity. Among male students, there was no significant association between obesity and sleep duration. Better understanding of factors underlying the association between sleep duration and obesity is needed before recommending alteration of sleep time as a means of addressing the obesity epidemic among adolescents.

# How do we know which study to trust?

The Relationships between Life Satisfaction and Sleep Quality, Sleep Duration and Variability of Sleep in University Students

How do we know  
which study to trust?

## Study 2

**Association of Sleep Duration with Obesity among US High School Students**

# Why evidence quality matters

# Evidence is central

Regulatory advice 6: The OfS also expects a provider to **access a number of useful sources of evidence that can be used to inform the intervention strategies** as well as the individual activities that sit within.

# Not all studies are born equal

# What do we want to know?

Is this study likely to be accurate?

Validity

Would this study have consistent results each time?

Reliability

Can we use its findings?

Generalisability

# Types of evidence

## **Narrative evidence (Type 1)**

Narrative or a coherent theory of change

“We have a coherent explanation of what we do and why”  
“Our claims are research-based”

# Types of evidence

## **Empirical evidence (Type 2)**

Quantitative and/or qualitative evidence showing correlation

“We can demonstrate that our interventions are associated with beneficial results”

## **Narrative evidence (Type 1)**

Narrative or a coherent theory of change

## Types of evidence

“We believe our intervention causes improvement and can demonstrate the difference using a comparison group”

### **Causal evidence (Type 3)**

Methodologies that show the causal effect of an intervention

### **Empirical evidence (Type 2)**

Quantitative and/or qualitative evidence showing correlation

### **Narrative evidence (Type 1)**

Narrative or a coherent theory of change

# Narrative evidence (Type 1)

## Description

The impact evaluation provides a narrative or a coherent theory of change to motivate its selection of activities in the context of a coherent strategy

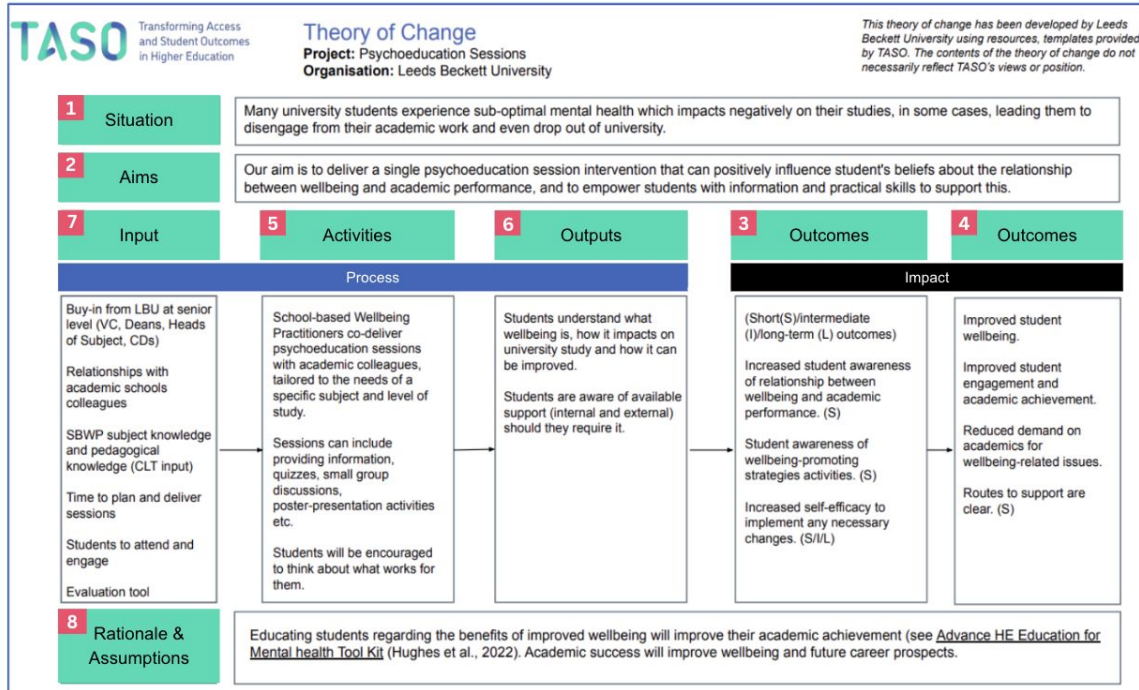

## Evidence

Evidence of impact elsewhere and/or in the research literature or from your existing evaluation results

## Claims you can make

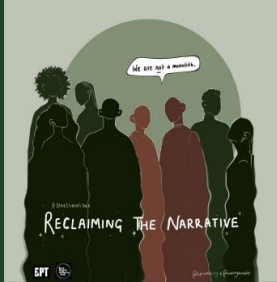

- “ We have a coherent explanation of what we do and why ”
- “ Our claims are research-based ”

## Attendee hub

<https://taso.org.uk/taso-annual-conference-2024-attendee-guide/resources/>

## Over to you!

Please click on **link for task 1** of day two resources on the attendee hub: Assessing the quality of evidence

1. Which elements of this report are useful in deciding the strength of the evidence?
2. What can you find? What is missing?

## Answers

There were four different versions of the signs and each drew on different principles from behavioural science - reciprocity bias, pro-social framing, endowment bias, time scarcity.

These **signs were installed on over one hundred fifty buses across Hammersmith, London (our pilot site)**, and the impact of the signs measured via on bus **observations, interviews and surveys** with drivers and interviews with passengers. Findings were compared with a **similar set of 'control' buses** that also operate in Hammersmith, but with no signs installed.

# Answers

Weaker evidence

Stronger evidence

# Causal evidence (Type 3)

## Description

The impact evaluation methodology provides evidence of a *causal* effect of an intervention

## Evidence

Quantitative and/or qualitative evidence of a pre/post treatment change on participants relative to an appropriate control or comparison group who did not take part in the intervention

## Claims you can make

“We believe our intervention causes improvement and can demonstrate the difference using a control or comparison group”

# What counts as evidence?

## A Mobile-Based Intervention to Increase Self-esteem in Students With Depressive Symptoms: Randomized Controlled Trial

## Assessing the quality of causal evidence

Pre-/ post-measures

Validated scales

Comparison groups

# Causal Evidence (Type 3)

## Description

The impact evaluation methodology provides evidence of a *causal* effect of an intervention

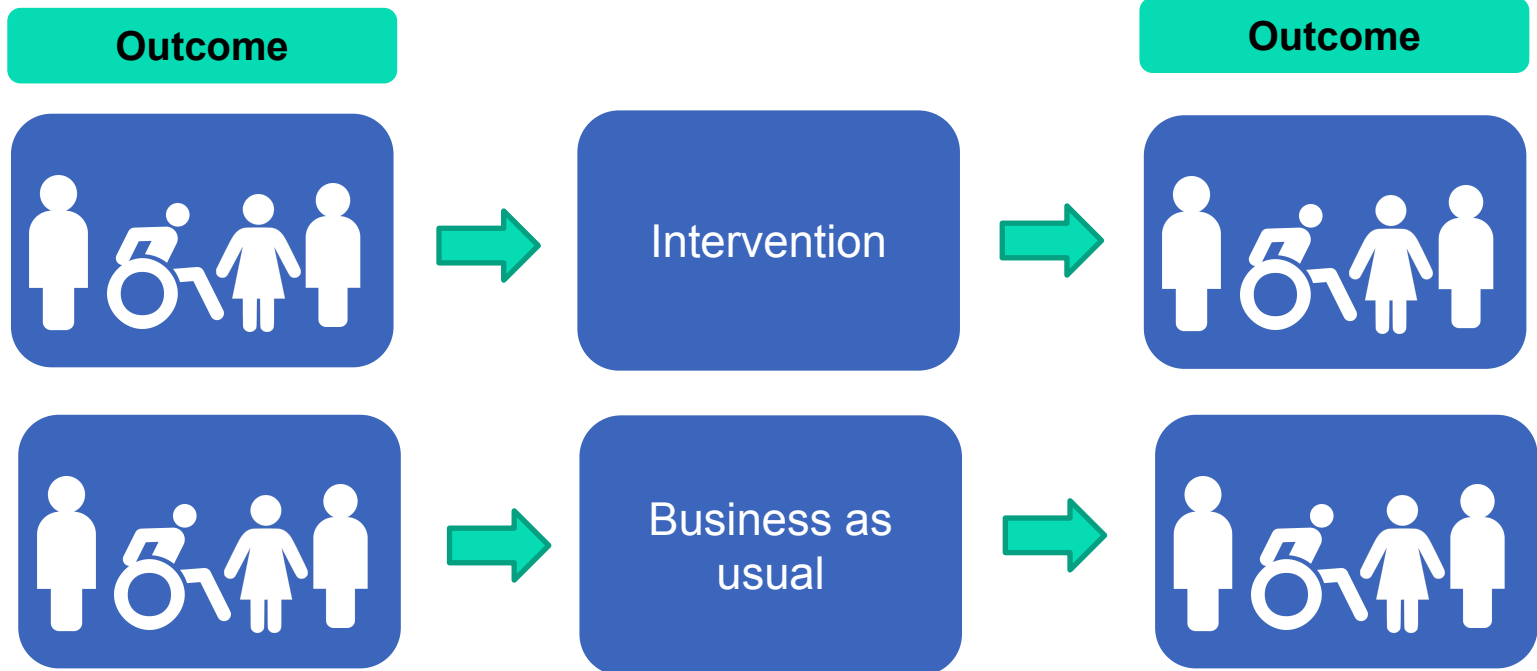

## Evidence

Quantitative and/or qualitative evidence of a pre/post treatment change on participants relative to an **appropriate control or comparison group** who did not take part in the intervention

## Claims you can make

“We believe our intervention causes improvement and can demonstrate the difference using a control or comparison group”

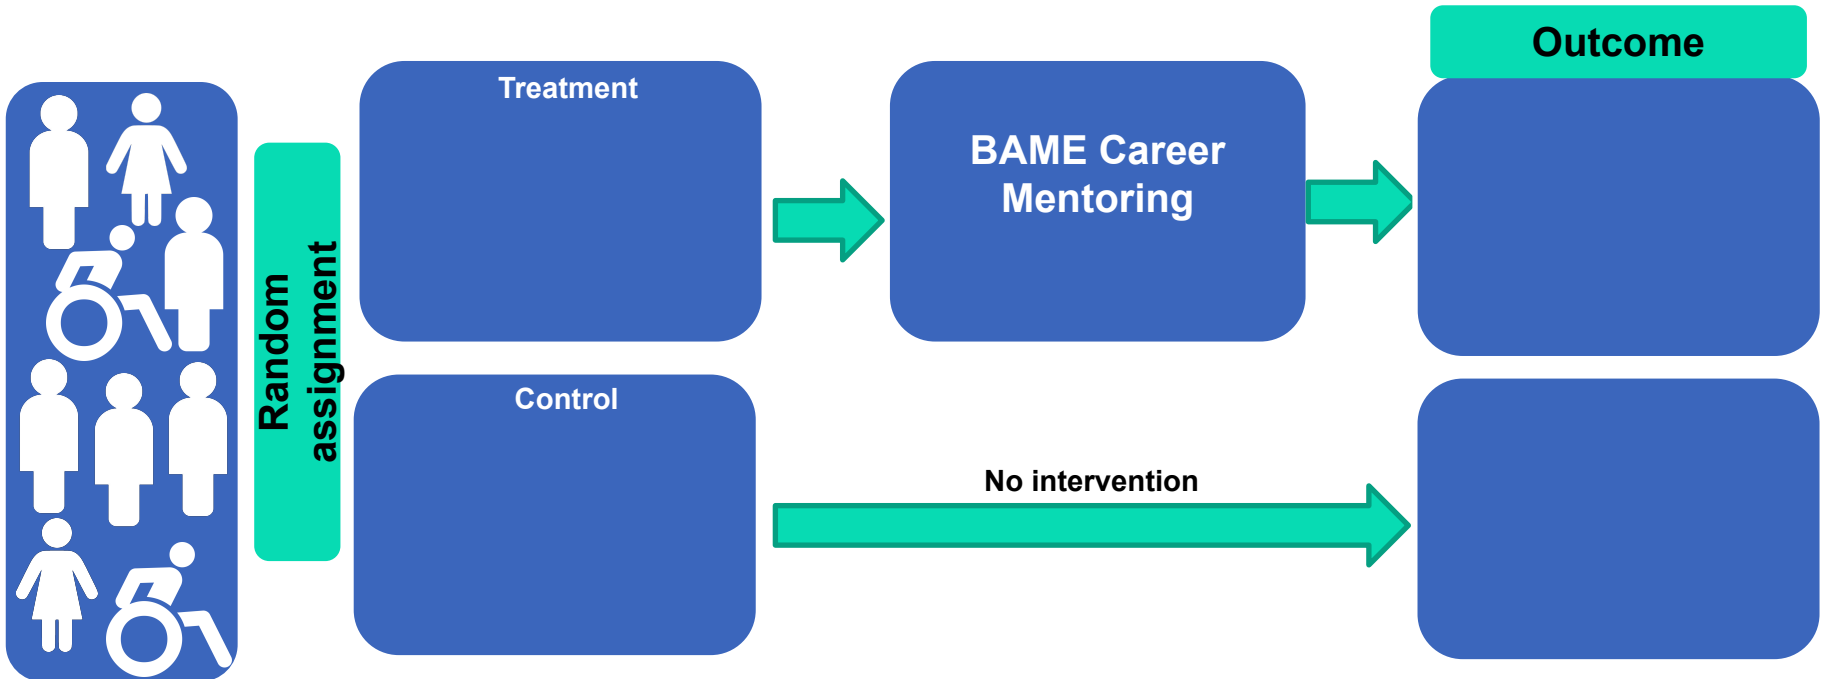

# A matched comparison group

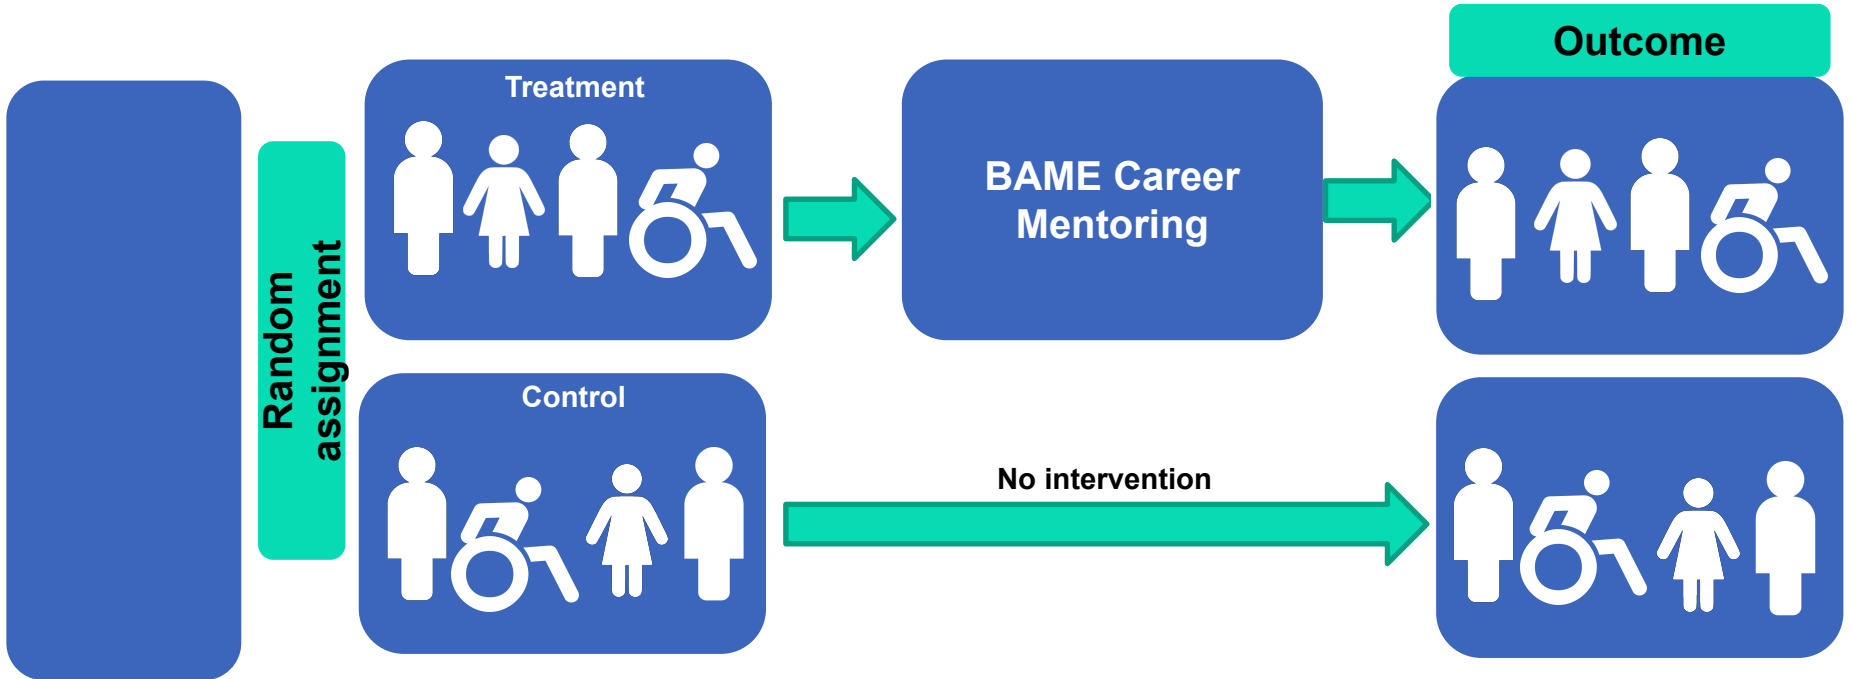

# Comparing different groups

- **Demographic differences are matched**
- **What about unobservable differences?** (e.g. individual motivation)

# Random comparison group

# Random comparison group

# Comparing different groups

- Now it is valid to assume that the two groups are roughly similar on their observable and unobservable characteristics.
- Therefore, observed differences in outcomes are **due to the intervention**, not pre-existing differences between groups.

**Validity**

**Reliability**

**Generalisability**

Conference:

**How to Evaluate**

#TasoCon24

TASO

# Unpacking your evaluation toolbox: Access and success questionnaire

#TasoCon24

## Who we are

Dr Katie Jones  
Research and Evaluation Manager  
The Brilliant Club

Rain Sherlock  
Head of Evaluation  
TASO

# Overview of session

- 1 The role of intermediate outcomes in HE
- 2 Introducing the Access and Success Questionnaire
- 3 Using validated scales in practice
- 4 Group activity and Q&A

TASO

# The role of intermediate outcomes in HE

#TasoCon24

# What are long-term and intermediate outcomes?

- **Long-term outcomes** are measured using behavioural outcomes. In the case of WP, we often identify progression to university and success at university (e.g., retention and attainment) as the long-term outcomes.
- **Intermediate outcomes** refer to changes in behaviour, skills and attitudes that are associated with changes in long-term outcomes.

# What types of intermediate outcomes matter?

Psychological constructs include:

- 1. Cognitive and metacognitive outcomes:** the mental processes that underpin learning (attention, memory, decision-making, self-regulation).
- 2. Motivational outcomes:** the degree to which individuals are engaged in their learning, including in the face of setbacks.
- 3. Self-perceptions:** individuals' feelings about their academic abilities and their levels of confidence.
- 4. Social outcomes:** individuals' perceptions of how they belong in HE and the extent to which they belong at university.

**What intermediate outcomes do you prioritise in your student access and success work?**

# How can we use scales to measure outcomes?

- To measure a psychological constructs, researchers often use questionnaires with multiple items.
- Items are added up to a score, and it is assumed that this score represents a person's position on the construct.
- It is important that the questionnaire has:
  - A good theory supporting the items you include in your scale.
  - A scale showing acceptable psychometric properties (e.g., reliability).
  - A scale related to other constructs in the ways hypothesised that captures group differences or causal processes expected to exist (e.g., in the case of WP, the outcome is associated with progression to or success at university).

TASO

# Introducing the Access and Success Questionnaire (ASQ)

#TasoCon24

## Introducing the ASQ

TASO

TASO's Access and Success Questionnaire, also referred to as the ASQ, is designed to support these evaluation efforts

The image features a teal background. On the left, there is a stylized illustration of a woman with dark hair, wearing a blue sleeveless top, holding a white clipboard with a pen. To the right of the illustration, the text 'TASO's Access and Success Questionnaire, also referred to as the ASQ, is designed to support these evaluation efforts' is displayed in white font, with each line of text contained within a dark teal rectangular box. The word 'TASO' is written in white in the top right corner of the teal area.

# Intermediate outcomes included in the ASQ

Outcome	Definition	Relevance
Academic self-efficacy	Individuals' confidence in their own ability to plan and execute the skills necessary to perform well academically in higher education.	Access (pre-entry)
Higher education expectations	The extent to which individuals expect to go to higher education.	
Knowledge of higher education	Individuals' knowledge about obtaining a place in higher education and what studying there might be like.	
Sense of belonging (pre-entry)	The extent to which individuals think they would feel connected to the higher education environment, peers, and others, if they were to progress to higher education.	
Cognitive strategies	The approaches individuals use to complete academic tasks and to prepare for and successfully learn.	Access (pre-entry) and Success (post-entry)
Metacognitive strategies	The approaches individuals use to monitor, plan and direct their own learning.	Success (post-entry)
Sense of belonging (post-entry)	The extent to which individuals feel connected to the higher education environment, peers, and others, and part of the community.	

# Academic self-efficacy

## Definition

Individuals' confidence in their own ability to plan and execute the skills necessary to perform well academically.

## Measurement

The academic self-efficacy scale in the ASQ includes items such as “I have the academic ability to do well in higher education.”

## Relevance to access and success

- In research, academic self-efficacy consistently emerges as one of the strongest correlates of attainment.
- There is a reciprocal relationship between academic self-efficacy and attainment, as students who attain highly are more likely to feel confident in their ability to do so again in future, which in turn boosts their attainment.
- Academic self-efficacy can be raised through interventions.

# Higher education knowledge and expectations

## Definition

Individuals' knowledge about how to apply to higher education, what higher education is like, and whether they expect to progress to higher education one day.

## Measurement

The higher education knowledge scale in the ASQ includes items such as "I know what studying in higher education would be like."

## Relevance to access and success

- It is important to ensure that all students have access to information about higher education, so they can make informed decisions about their future.
- However, this is unlikely to directly influence attainment, which is an important predictor of higher education progression.
- Additionally, students' expectations of whether they will progress to higher education is influenced by a complex set of factors that are not all within the scope of an intervention.

# Sense of belonging

## Definition

The extent to which individuals feel like they belong in higher education (post-entry), or would belong if they were to progress (pre-entry).

## Measurement

The sense of belonging scale in the ASQ includes items such as "Higher education is for people like me."

## Relevance to access and success

- University students with a higher sense of belonging are more likely to persist with their studies and have higher attainment.
- Studies from the US show that sense of belonging can be improved through interventions with university students from underrepresented backgrounds.
- Interim findings from TASO's summer school evaluation indicate that access programmes can improve sense of belonging pre-entry

# Cognitive strategies

## Definition

The approaches individuals use to complete academic tasks and to prepare for and successfully learn.

## Measurement

The cognitive strategies scale in the ASQ includes items such as "I can tell which information is most important when I study."

## Relevance to access and success

- Using effective cognitive strategies has consistently been linked to higher attainment.
- However, studies have shown that students often do not use the most effective cognitive strategies, such as spreading studying out over time and practice testing.
- Teaching students how to use effective cognitive strategies can therefore contribute to raising attainment.

# Metacognitive strategies

## Definition

The approaches individuals use to monitor, plan and direct their own learning.

## Measurement

The metacognitive strategies scale in the ASQ includes items such as “I can tell when I have understood a concept or idea.”

## Relevance to access and success

- At both school and university, metacognitive strategies contribute significantly to attainment.
- This link is found in both correlational and intervention studies across different subjects.
- Metacognition can be improved by teaching metacognitive strategies and showing students how to select an appropriate strategy for a specific task.

# Scales included in ASQ

Scale*	No. of items	Example scale item	Age group
Academic self-efficacy	3	"I have the academic ability to do well in higher education."	Y7-Y13 (age 11/12-17/18)
Higher education expectations	1	"I am thinking about going to higher education in the future."	
Knowledge of higher education	3	"I know what studying in higher education would be like."	
Sense of belonging (pre-entry)	3	"Higher education is for people like me."	
Cognitive strategies	4	"I can tell which information is most important when I study."	Y7-Y13 (age 11/12-17/18) and HE
Metacognitive strategies	5	"I can tell when I have understood a concept or idea."	HE
Sense of belonging (post-entry)	4	"I feel I belong in higher education"	

\*Response options: Strongly disagree (1) – Disagree (2) – Neither agree nor disagree (3) – Agree (4) – Strongly agree (5)

TASO

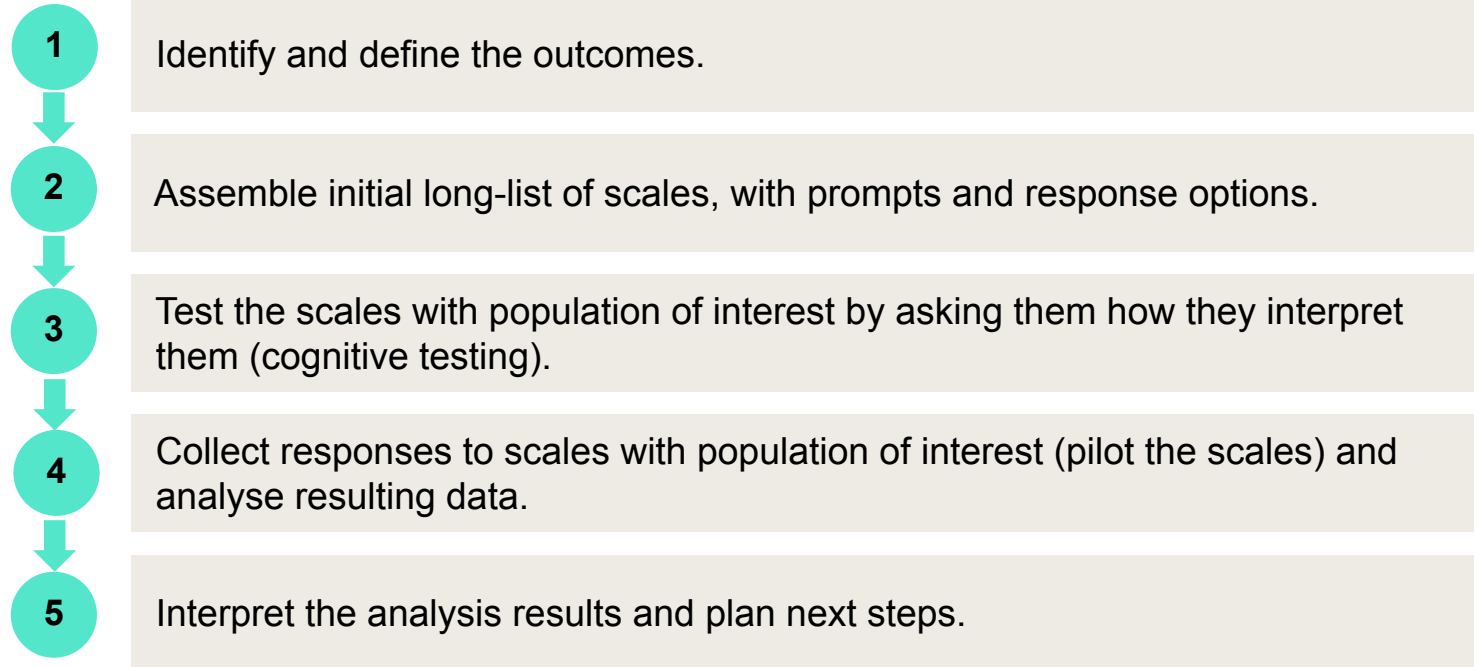

# The validation process

#TasoCon24

## Why survey validation matters

- Intermediate outcomes are an important part of evaluating access and student success interventions – they are associated with positive changes in attainment, progression to and success in HE.
- If we don't have the tools to meaningfully evaluate these outcomes within our interventions with our target students, we will never truly know the impact of the work that we do.
- We have validated a multi-scale questionnaire for the sector that can be used to measure intermediate outcomes relevant to access and student success work.

# Validation process: an overview

# Step 1 & 2: Identify and define the outcomes

## IDENTIFYING OUTCOMES

Rapid Evidence Review and Sector Consultation

Survey & Focus Groups

### Scales:

1. Higher education aspirations and expectations
2. Academic self-efficacy
3. Sense of belonging
4. Motivation
5. Growth mindset
6. Study skills
7. Metacognition

## ANALYSING EXISTING DATA

Data from The Brilliant Club for sample of 23,000+ learners

### Scales:

1. Academic self-efficacy
2. Sense of belonging, pre-entry
3. Cognitive strategies
4. Metacognitive strategies
5. Knowledge of higher

## SHORT-LIST OF SCALES

Scale items derived from combined evidence from previous two steps and a review of existing scales.

## Step 3: Test the scales (cognitive testing)

### **COGNITIVE TESTING (Round 1)**

Qualitative approach with twelve participants, aged 14 to 22

#### **Scales:**

1. Academic self-efficacy
2. Sense of belonging, pre-entry
3. Sense of belonging, post-entry version 2
4. Cognitive study strategies
5. Metacognitive strategies
6. Critical engagement with information
7. Knowledge of higher education
8. Higher education intentions and expectations

### **REFINED WORDING OF SCALE ITEMS**

Scale items refined based on insights from cognitive testing and earlier analysis.

# Step 4: Collect responses and analyse results

## TESTING SCALES WITH NEW SURVEY DATA

### FIRST SURVEY

Sample of 386 young people in & out of education aged 16-22

### SECOND SURVEY

Sample of 121 sixth-form learners

### THIRD SURVEY

Sample of 52 higher education learners

Scales across the three surveys:

1. Academic self-efficacy
2. Sense of belonging, pre-entry
3. Sense of belonging, post-entry version 1
4. Sense of belonging, post-entry version 2
5. Cognitive study strategies
6. Metacognitive strategies
7. Critical engagement with information
8. Knowledge of higher education
9. Higher education intentions and expectations

## PARTIALLY-VALIDATED SCALES

Scales and constituent items derived from combined evidence across all previous steps

Shared for trial use with Higher Education Providers.

# Repeat steps 3 & 4 and complete step 5

## TESTING SCALES WITH NEW HEP DATA

Scales trialled by Higher Education Providers with over 3,300 learners. Data provided directly or via the Higher Education Access Tracker (HEAT).

### Scales:

1. Academic self-efficacy
2. Sense of belonging, prospective
3. Sense of belonging, post-entry
4. Cognitive study strategies
5. Metacognitive strategies
6. Critical engagement with information
1. Higher education knowledge and expectations

## ANALYSING EXISTING DATA (Sub-group and younger age with data from The Brilliant Club)

Further analysis of existing data, focused on specific sub-groups (including defined by gender, first-in-family in higher education) and specifically looking at learners aged 11 to 12 only.

**Scales: as per HEP data testing**

## COGNITIVE TESTING (Round 2)

Qualitative approach with six participants, aged 11 to 13. Further minor refinements to a small number of items were made following this final round of cognitive testing.

**Scales: as per HEP data testing**

**FINAL SCALES AND ITEMS**  
The ASQ

## Seven scales included in the ASQ

Academic self-efficacy

Knowledge of higher education

Cognitive strategies

Sense of belong (pre-entry)

Higher education expectations

Metacognitive strategies

Sense of belonging (post-entry)

TASO

# Using validated scales in practice

#TasoCon24

## How to use the ASQ

### STEP 1: IDENTIFY THE PROGRAMME AND ITS OUTCOMES

- For guidance about how to identify the best outcome measure for a programme, check the TASO Monitoring and Evaluation Framework and consider using the Mapping Outcomes and Activities Tool (MOAT).

### STEP 2: DESIGN THE EVALUATION

- Decide what kind of evidence the evaluation will generate. Validated scales are most useful for generating Type 2 (empirical) or Type 3 evidence (Causal). For example, you may use the ASQ as part of a pre-post survey design to generate Type 2 evidence.

## How to use the ASQ

### STEP 3: IDENTIFY RELEVANT VALIDATED SCALES

- Specify in your evaluation plan precisely which validated scale you will use, and how you will collect data with it. This includes outlining when the scale will be administered, to whom, and whether on paper or in an online format.

### STEP 4: CARRY OUT THE EVALUATION AND RECORD THE DATA

- Record the data you have collected using the ASQ validated scales. You may use the ASQ spreadsheet, that allows for input of any data you may have collected using ASQ validated scales.
- HEAT now includes a facility to collect and upload data from any of the ASQ validated scales.

## What to do if we cannot use a validated scale?

- Make modest changes to the wording and structure of existing scales to improve their usability in your context.
- Consider developing bespoke, validated, scales specifically for the constructs you are interested in.
- Use TASO guidance on how to develop validated scales.

## How is the sector using the ASQ?

- In Access and Participation Plans to measure intermediate outcomes for access and student success intervention strategies
- Via the Higher Education Access Tracker (HEAT) survey tool
- Via HEP administered surveys as part of their evaluation activity
- As the basis for developing additional bespoke validated scales

Group activity

#TasoCon24

An abstract graphic consisting of numerous thin, wavy lines in shades of blue and green, flowing from the top right towards the bottom right of the slide.

# Attendee hub

<https://taso.org.uk/taso-annual-conference-2024-attendee-guide/resources/>

## Using the ASQ in your work

1

Start by identifying the programme or activity you'd like to evaluate

2

Match your desired outcome with the relevant validated questionnaire scale

3

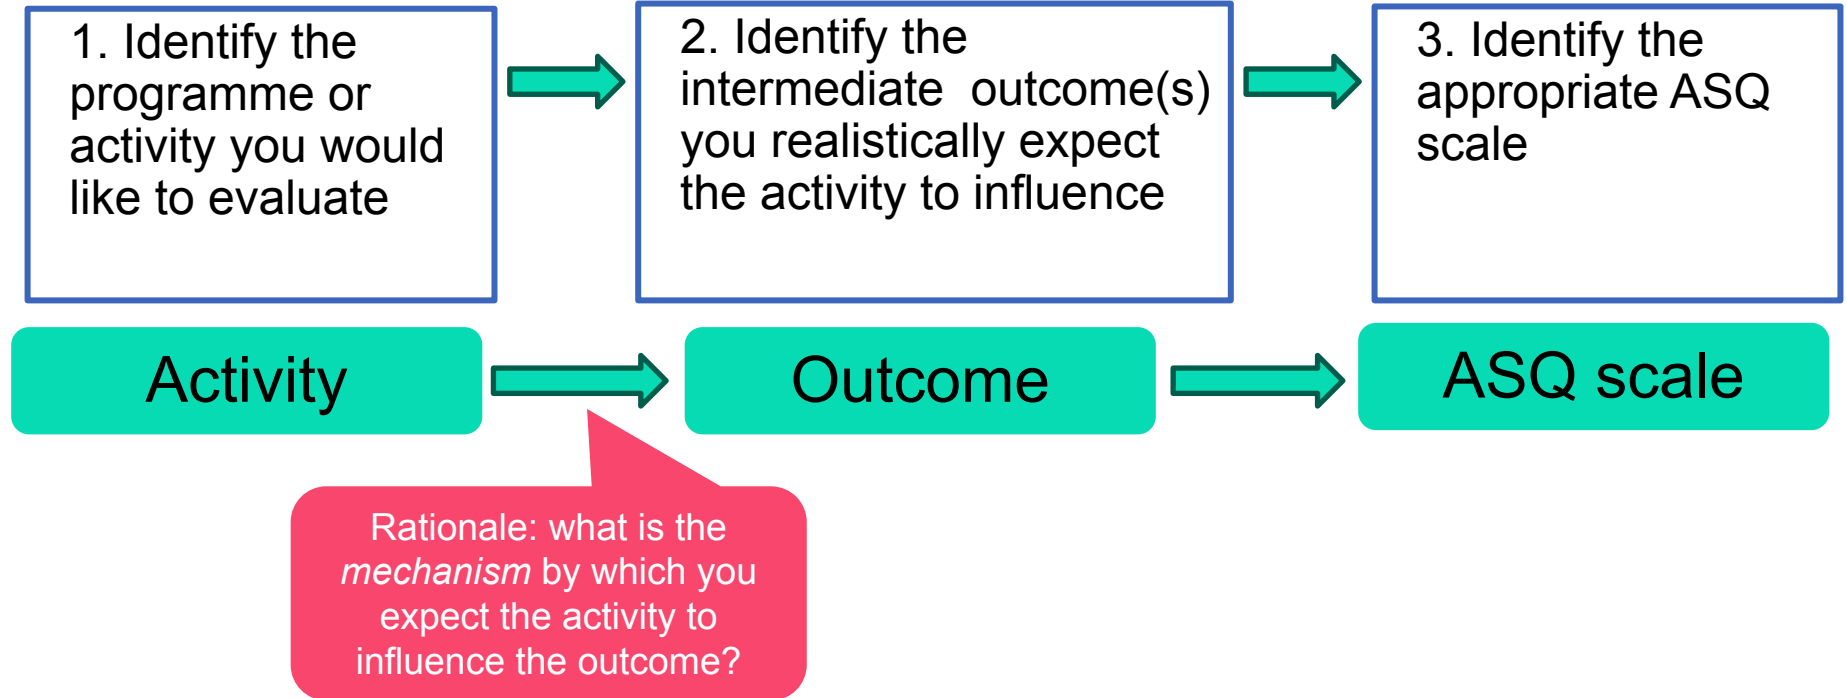

Use the scale in a survey of participants (and any comparison group if applicable)

4

Collect and analyse the data

## Using the ASQ in your work

- 4 Some thoughts on process

TASO

# Evaluation and Research

#TasoCon24

An abstract graphic consisting of numerous thin, light blue lines that flow and curve across the right side of the slide, creating a sense of motion and depth.

Audit	Research
Never involves experiments <sup>1</sup> on human subjects	May involve experiments on human subjects
Is a systematic approach to the peer review of educational support to identify opportunities for improvement and to provide a mechanism for bringing them about	Is a systematic investigation that aims to increase the sum of knowledge
Never involves allocating people randomly to different treatment groups	May involve allocating people randomly to different treatment groups
Never involves a completely new intervention	May involve a completely new intervention
Never involves disturbance to the participants beyond that required for normal educational activity	May involve extra disturbance or work beyond that required for normal educational activity
May involve students/pupils with the same educational need being given different interventions, but only after full discussion of the known advantages and disadvantages of each approach. The student/pupils can choose freely which intervention they receive	May involve the application of strict selection criteria to students/pupils with the same educational need before they are entered into the research study
Measures against a standard set of expectations to address educational needs	Usually involves an attempt to test a hypothesis
Is used to inform internal policy and practice with limited circulation to those involved in the activities	Is intended to be communicated to a broad audience beyond the individuals and institutions directly involved

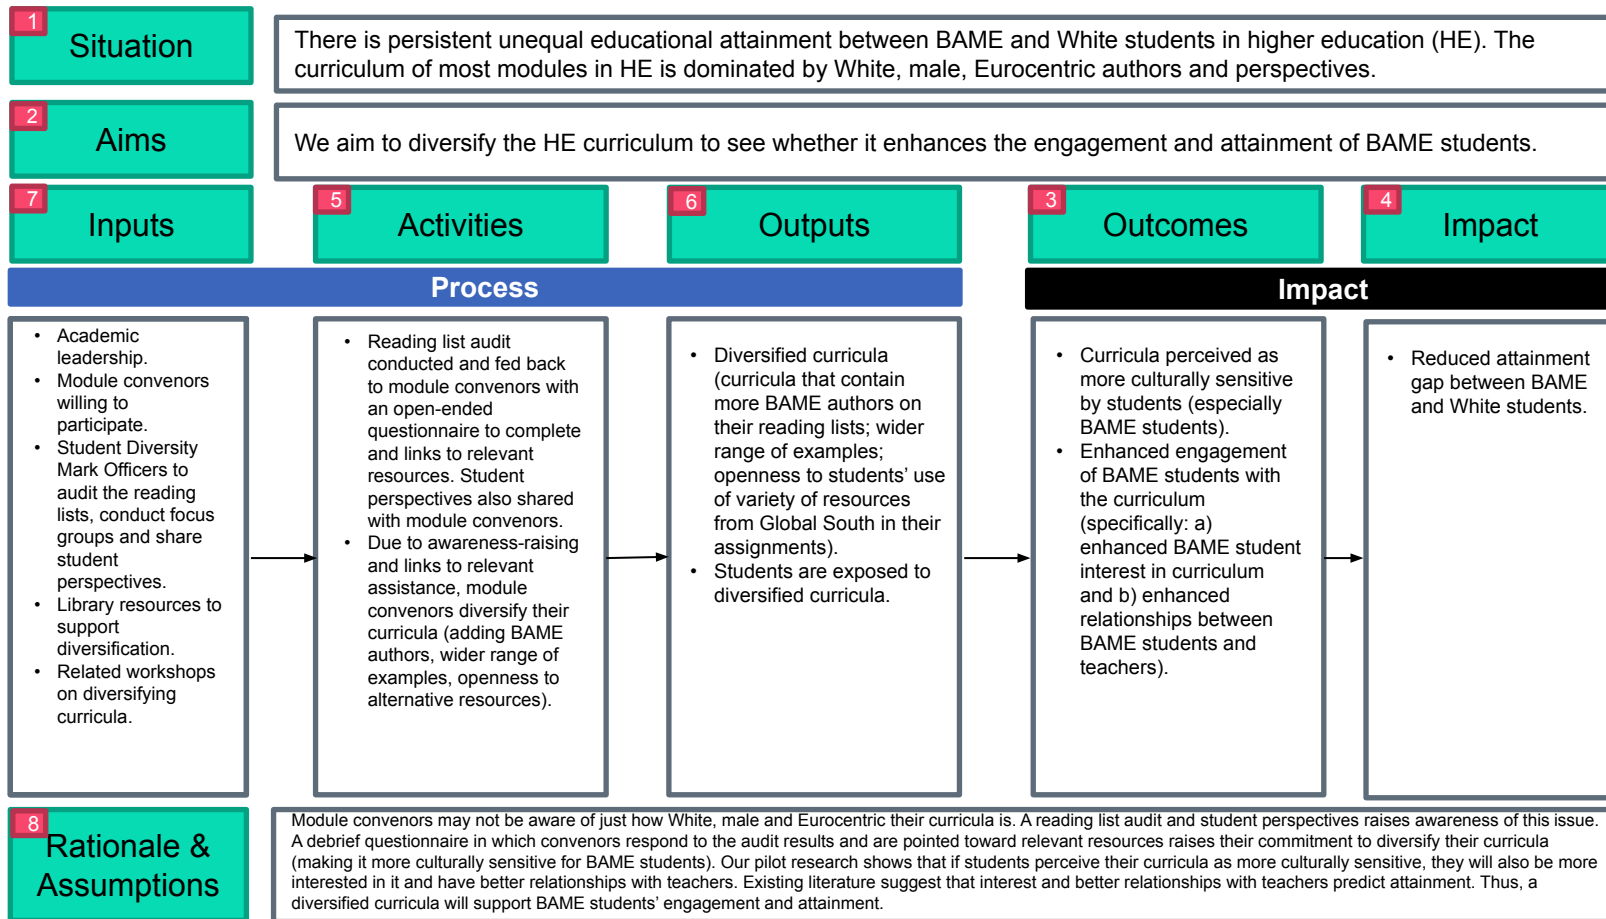

TASO

# Case studies

#TasoCon24

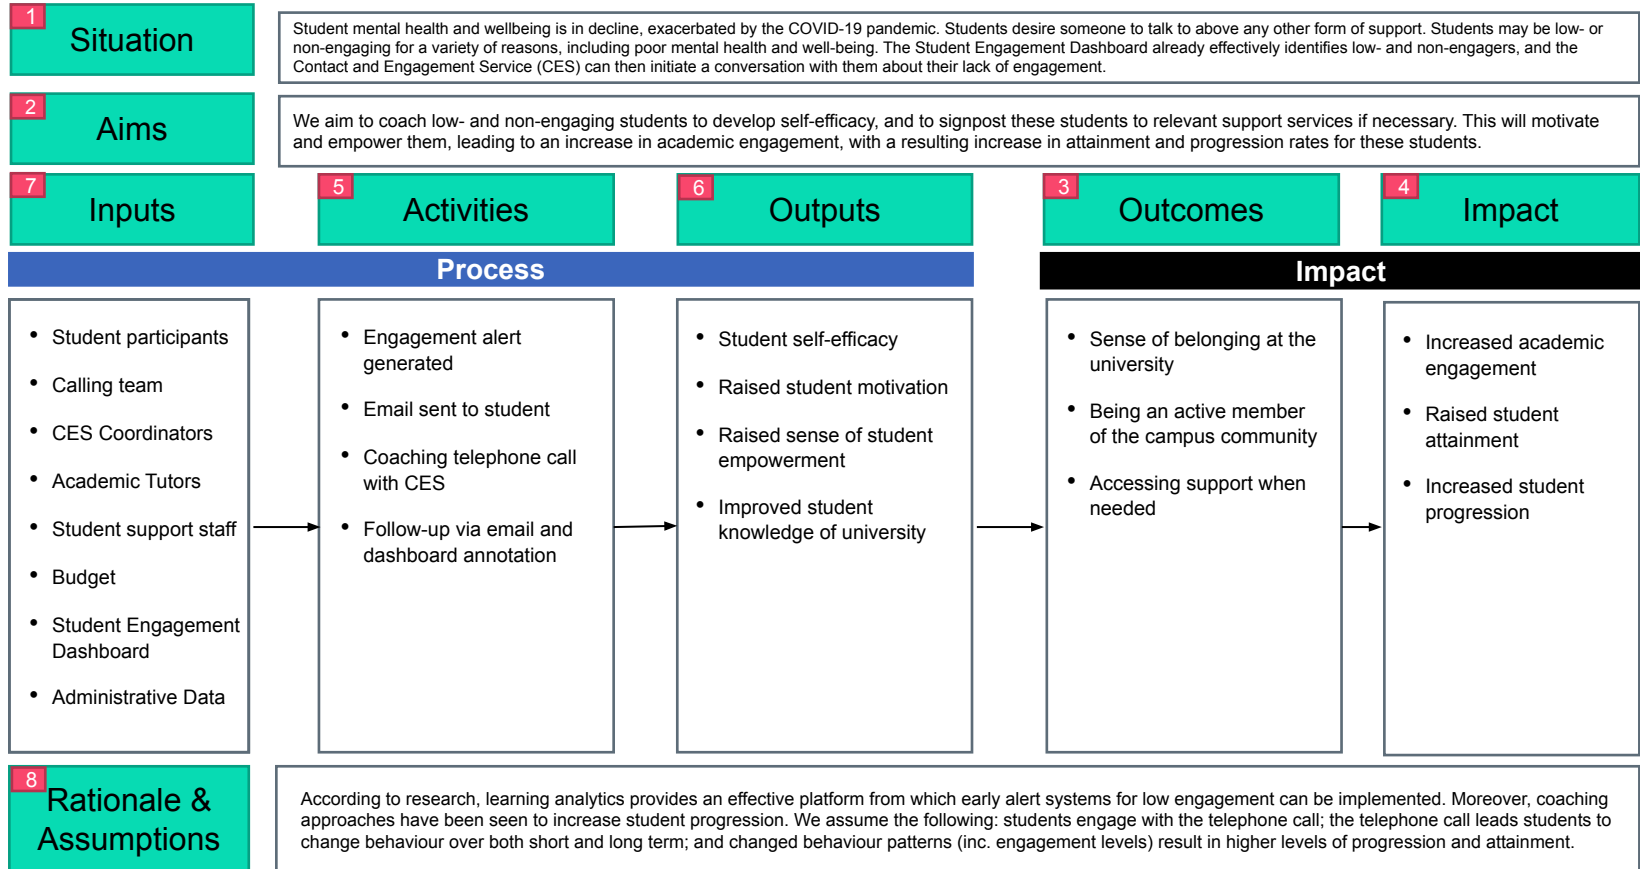

An abstract graphic consisting of numerous thin, wavy lines in shades of blue and green, flowing from the top right towards the bottom right of the slide.

# Example one

## Outcomes

- Curricula perceived as more culturally sensitive by students (especially BAME students).
- Enhanced engagement of BAME students with the curriculum (specifically: a) enhanced BAME student interest in curriculum and b) enhanced relationships between BAME students and teachers).

## Example two

- The evaluation is more difficult to operationalise
- It most likely involves quantitative data analysis
  - ***These have ethical as well as quality implications***
- Deals with topics students might find disturbing
  - ***Requires sensitive handling and signposting to well-being support***
- Students need to know what is required and why it is worth doing
  - ***Requires clear messaging to ensure informed consent***

TASO

# Important considerations

#TasoCon24

An abstract graphic consisting of numerous thin, wavy lines in shades of blue and green, flowing from the top right towards the bottom right of the slide.

## Important considerations

- Level of risk
- Lack of experience
- Institution level effects

TASO

# Some thoughts on process

#TasoCon24

An abstract graphic consisting of numerous thin, wavy lines in shades of blue and green, flowing from the top right towards the bottom right, creating a sense of movement and depth.

# Some thoughts on process

- Clearly separate *the activities* from *the evaluation*
- Clearly limit expedited review for low-risk evaluations only
- Be clear about what is data collection and secondary use of existing data
- Potential risks are considered, recorded, and mitigated
- Data ought to be securely managed
- If in doubt – go for a full review
